

ABSTRACT OF THE DISCLOSURE

A system is disclosed that includes a baseline web site that is primarily and ordinarily read-only. The baseline web site has a number of web pages. The web pages are remotely accessible by authorized users through a network, via client communication devices communicatively coupled to the network. A mirror web site that is initially a mirror copy of the baseline site is remotely accessible, by the authorized users via the client communication devices communicatively coupled to the network. A web application running on the mirror site accepts user-made changes to the mirror copy of the baseline site in a cut-and-paste manner. Administrators authorize the user-made changes, so the baseline site is periodically updated from the mirror site.
